### Description

Garlic Mist Regular

To say that *Garlic Mist* is unique would be an understatement. This strain is really something special. Breeders skillfully enhanced the desired traits over generations to produce incredible aromas and potent medicinal properties.

*Garlic Mist* inherited most of her pungent terpene profile from parent strain Garlic Bud. This indica-dominant variety first appeared in the 1990s. The strain was famed for its scent of musk, spice, and tanginess. She was merged with Cali Sativa Haze to add lively sativa genetics to the mix. *Garlic Mist* features a perfect balance of **50% sativa** genetics and **50% indica**.

*Garlic Mist* offers both indica and sativa effects. Her even genetic split is extremely apparent during the high. After hitting a bong or blunt, you'll experience her sativa effects take hold. A jolt of energy darts toward the mind and instantly elevates the mood. The senses sharpen, and it's not uncommon to fall into a giggle fit. Eventually, the high tapers off into a calm body stone. The indica effects melt the muscles, trigger the munchies, and help to relieve aches and pains.

*Garlic Mist* flowers produce an unusual yet pleasant smell. During the flowering phase, the grow room fills up with aromas of garlic and spices. She smells much more savoury than most strains. It's a mouthwatering experience. Slightly different terpenes come to the fore when smoking her buds, as tastes of garlic, lemon, and citrus roll across the tongue.

*Garlic Mist* produces massive yields indoors and outdoors, yet adopts more of an indica growth pattern. Indoor plants reach a medium height and provide a return of **600gr/m<sup>2</sup>**. Expect to harvest her buds after a flowering time of around 65 days. Plants grown outdoors also maintain a medium height, yet produce a substantial yield of **700gr/plant**. You won't be running out of bud anytime soon! Outdoor plants will be ready to harvest in early October.
